

Deforestation

Deforestation is a devastating practice that is currently happening on planet earth. It leads to many animals going endangered or becoming totally extinct, since they have no time to respond to their homes and food sources being destroyed. Did you know 80 percent of land animals live in the rainforest? Most of these animals will perish due to the loss of their homes and food. One of the other dangers of deforestation, and the biggest, is the carbon dioxide that is going into the atmosphere since that trees take in carbon dioxide (which is a poisonous gas) and give us oxygen to breathe, we will now have much less due to the trees being cut down. Ways to reduce carbon dioxide are: reducing energy use, and putting on a jumper from time to time instead of burning fossil fuels, ride a bike or walk instead of cars and pumping exhaust into the air, switch to an electric vehicle or take public transport and reduce, reuse, repair and recycle.
